

1. **ATR Breakout Channel** – (Parent Family: Technical – Indicator-Based, Type: Variation)

2. *Core Logic*: Use ATR to define breakout levels above/below a moving average; enter when price breaches the channel.

3. *How it Works*: Calculate 20-period ATR; compute mid-line (e.g., 20-period EMA); set upper/lower channel at $\pm k \times \text{ATR}$; go long/short on close outside channel.

4. *Typical Use Case*: Capturing volatility expansions while filtering out noise.

5. *Known Users/Origin*: Variation of Keltner channel; widely used by algorithmic traders.

6. *Evidence Type*: Common practice.

7. *Confidence Level*: Medium.

8. **Ichimoku Cloud Trend Strategy** – (Parent Family: Technical – Indicator-Based, Type: Core)

9. *Core Logic*: Utilise the Ichimoku Cloud to identify trend direction, support/resistance and momentum.

10. *How it Works*: Plot Tenkan-sen, Kijun-sen, Senkou Span A/B; go long when price is above cloud with Tenkan-sen above Kijun-sen; exit when price falls below cloud.

11. *Typical Use Case*: Longer-term swing trades; capturing major trends in Bitcoin or ETH.

12. *Known Users/Origin*: Developed by Goichi Hosoda in Japan; widely used in FX and crypto.

13. *Evidence Type*: Institutional/Academic and common practice.

14. *Confidence Level*: Medium.

15. **Parabolic SAR Trend Following** – (Parent Family: Technical – Indicator-Based, Type: Core)

16. *Core Logic*: Use Parabolic SAR dots to determine trend direction and trailing stop; dots below price signal long; above price signal short.

17. *How it Works*: SAR calculation uses accelerating factor; start at 0.02 and increase on each new high/low; exit when price crosses SAR dot and dot flips sides.

18. *Typical Use Case*: Trend following with clear exit rules; useful in trending markets.

19. *Known Users/Origin*: J. Welles Wilder indicator; widely adopted.

20. *Evidence Type*: Institutional/Academic and common practice.

21. *Confidence Level*: Medium.

22. **On-Balance Volume (OBV) Confirmation** – (Parent Family: Technical – Volume Analysis, Type: Core)

23. *Core Logic*: Use OBV line to confirm price trends; rising OBV with rising price indicates strong buying interest.

24. *How it Works*: OBV adds volume on up days and subtracts on down days; divergences between OBV and price hint at trend reversals.
25. *Typical Use Case*: Confirm breakouts or mean-reversion setups; early detection of accumulation/distribution.
26. *Known Users/Origin*: Developed by Joseph Granville; widely used by technical analysts.
27. *Evidence Type*: Institutional/Academic and common practice.
28. *Confidence Level*: Medium.
29. **Relative Volume (RVOL) Spike Breakout** – (Parent Family: Technical – Volume Analysis, Type: Variation)
30. *Core Logic*: Monitor relative volume (current volume divided by 30-period average); spikes above 2–3 signal strong interest and potential trend continuation ¹.
31. *How it Works*: Calculate RVOL; when price breaks a key level and $RVOL > 2$, enter in direction of breakout; low RVOL suggests caution.
32. *Typical Use Case*: Confirming breakouts from support/resistance or patterns.
33. *Known Users/Origin*: altFINS explains RVOL for crypto traders ¹.
34. *Evidence Type*: Exchange/Crypto-native (analysis platform) and common practice.
35. *Confidence Level*: Medium.
36. **Volume Weighted Average Price (VWAP) Mean Reversion** – (Parent Family: Technical – Volume Analysis, Type: Core)
37. *Core Logic*: Compare current price to intraday VWAP; trade long when price is below VWAP and reverts upward; short above VWAP expecting reversion downward.
38. *How it Works*: Calculate VWAP each day; treat VWAP as mean; open long positions when price deviates significantly below with supportive order flow; exit near VWAP.
39. *Typical Use Case*: Day trading on perpetual futures; capturing intraday mean reversion.
40. *Known Users/Origin*: Institutional traders use VWAP for execution; adopted by crypto traders.
41. *Evidence Type*: Institutional and common practice.
42. *Confidence Level*: Medium.
43. **Volume Price Trend (VPT) Divergence** – (Parent Family: Technical – Volume Analysis, Type: Variation)
44. *Core Logic*: Use VPT indicator (cumulative volume adjusted by price change) to spot divergences; rising price with falling VPT warns of distribution.
45. *How it Works*: Calculate VPT; compare slope vs price; a bearish divergence occurs when price hits new highs but VPT does not; traders may exit or short.
46. *Typical Use Case*: Confirm or invalidate breakouts and trend continuation.
47. *Known Users/Origin*: Variation used by volume analysts; not clearly attributable.
48. *Evidence Type*: Common practice.

49. *Confidence Level*: Low (needs validation).

50. **Trendline Break Strategy** – (Parent Family: Technical – Price Action, Type: Core)

51. *Core Logic*: Draw diagonal trendlines along higher lows in an uptrend or lower highs in a downtrend; break of trendline signals potential reversal.

52. *How it Works*: Connect at least two swing lows; when price closes below rising trendline, exit long or enter short; confirm with volume or other indicators.

53. *Typical Use Case*: Managing positions in trending coins, capturing early reversal signs.

54. *Known Users/Origin*: Chartists; widely used.

55. *Evidence Type*: Common practice.

56. *Confidence Level*: Medium.

57. **Channel Breakout** – (Parent Family: Technical – Price Action, Type: Variation)

58. *Core Logic*: Identify ascending or descending channels; trade breakouts when price closes outside the channel.

59. *How it Works*: Draw parallel trendlines across swing highs and lows; go long when price breaks above an ascending channel; short when it breaks below descending channel.

60. *Typical Use Case*: Trend continuation after consolidation within channels.

61. *Known Users/Origin*: Classical chart technique; widely taught.

62. *Evidence Type*: Common practice.

63. *Confidence Level*: Medium.

64. **Inside Bar Breakout** – (Parent Family: Technical – Price Action, Type: Variation)

65. *Core Logic*: An inside bar (narrow range) following a large move signals consolidation; breakout from the inside bar sets next direction.

66. *How it Works*: Identify mother bar (large candle) and inside bar; place buy stop above high and sell stop below low of mother bar; whichever triggers first determines direction.

67. *Typical Use Case*: Short-term breakout trades on daily or 4-hour charts.

68. *Known Users/Origin*: Price action traders.

69. *Evidence Type*: Common practice.

70. *Confidence Level*: Medium.

71. **False Breakout (Fade)** – (Parent Family: Technical – Price Action, Type: Variation)

72. *Core Logic*: Identify a false breakout when price briefly breaks support/resistance but then returns; fade the breakout by trading opposite the initial move.

73. *How it Works*: After breakout, if price fails to close outside range and quickly reverses, enter trade toward original range; stops beyond false break high/low.
74. *Typical Use Case*: Counter-trend traders seeking to exploit stop-hunt liquidity events.
75. *Known Users/Origin*: Experienced discretionary traders; not clearly attributable.
76. *Evidence Type*: Common practice.
77. *Confidence Level*: Medium.
78. **Trend Following with Supertrend Indicator** – (Parent Family: Technical – Indicator-Based, Type: Variation)
79. *Core Logic*: Supertrend indicator uses ATR and multiplier to generate trailing stop line; changes colour when trend flips.
80. *How it Works*: Compute ATR; set multiplier (e.g., 3); Supertrend draws line below price in uptrend and above in downtrend; go long when price crosses above line and line turns green; exit when line flips.
81. *Typical Use Case*: Swing trading trending pairs with simple visual cues.
82. *Known Users/Origin*: Variation of ATR; widely used in trending markets.
83. *Evidence Type*: Common practice.
84. *Confidence Level*: Medium.
85. **Heikin-Ashi Trend Filter** – (Parent Family: Technical – Price Action, Type: Variation)
86. *Core Logic*: Use Heikin-Ashi candlesticks to smooth price noise and identify trend direction; long when candles are continuously green; exit when a red candle appears.
87. *How it Works*: Heikin-Ashi calculation uses average values of open/high/low/close; consecutive green candles with no lower wicks show strong uptrend; traders hold long until red candle forms.
88. *Typical Use Case*: Filtering noise for swing trades; trending markets like Bitcoin or ETH.
89. *Known Users/Origin*: Derived from Japanese charting; widely used.
90. *Evidence Type*: Common practice.
91. *Confidence Level*: Medium.
92. **Donchian Channel Breakout** – (Parent Family: Technical – Breakout, Type: Subtype)
93. *Core Logic*: Buy when price breaks above the highest high of the last N periods; sell when it breaks below the lowest low.
94. *How it Works*: Calculate N-period high and low; place buy stop at high and sell stop at low; adjust N depending on timeframe (e.g., 20-day for medium-term, 55-day for long-term); exit via trailing stop or reverse breakout.
95. *Typical Use Case*: Turtle trading system; capturing big trends.
96. *Known Users/Origin*: Richard Donchian and the Turtle traders popularised; widely used by system traders.
97. *Evidence Type*: Institutional/Academic and common practice.

98. *Confidence Level*: High.

99. **Turtle Trading System** – (Parent Family: Technical – Breakout, Type: Variation)

100. *Core Logic*: Use two Donchian channels (20-day for entries, 10-day for exits) with position sizing rules; scale into positions as price moves favourably.

101. *How it Works*: When price exceeds 20-day high, go long; exit when price falls below 10-day low; use ATR-based position sizing; risk 2% per trade.

102. *Typical Use Case*: Capturing long-term trends in crypto futures; replicating 1980s Turtle system in digital assets.

103. *Known Users/Origin*: Created by Richard Dennis and William Eckhardt; some crypto funds replicate.

104. *Evidence Type*: Institutional (Turtle story) and common practice.

105. *Confidence Level*: Medium.

106. **Momentum Oscillator (ROC) Strategy** – (Parent Family: Technical – Momentum, Type: Core)

107. *Core Logic*: Use the Rate of Change (ROC) indicator to measure percentage price change; values crossing zero indicate momentum shifts.

108. *How it Works*: Compute ROC over 12 periods; when ROC crosses from negative to positive, go long; cross from positive to negative, go short; confirm with trend filter.

109. *Typical Use Case*: Identifying early momentum surges in altcoins.

110. *Known Users/Origin*: Technical traders; indicator from early technical analysis.

111. *Evidence Type*: Common practice.

112. *Confidence Level*: Medium.

113. **Average Directional Index (ADX) Trend Strength Filter** – (Parent Family: Technical – Momentum, Type: Subtype)

114. *Core Logic*: Use ADX to measure trend strength; values above 25 indicate strong trend; combine with DI+ and DI– crosses.

115. *How it Works*: Calculate ADX and directional indicators; go long when DI+ crosses above DI– and ADX > 25; exit when DI+ crosses below or ADX falls below 20.

116. *Typical Use Case*: Filtering signals in momentum strategies like moving-average cross to avoid false signals in choppy markets.

117. *Known Users/Origin*: Developed by J. Welles Wilder; widely used.

118. *Evidence Type*: Institutional/Academic and common practice.

119. *Confidence Level*: Medium.

120. **Squeeze Momentum Indicator** – (Parent Family: Technical – Momentum, Type: Variation)

121. *Core Logic*: Combines Bollinger Bands and Keltner Channels to identify when volatility is low (squeeze) and uses momentum histogram to trade the expansion.
122. *How it Works*: When Bollinger Bands narrow inside Keltner Channels, a squeeze is active; when bands break out, momentum histogram indicates direction; go long/short accordingly.
123. *Typical Use Case*: Identifying big moves after consolidation; used on daily/4-hour charts.
124. *Known Users/Origin*: Created by John Carter; widely used by retail traders.
125. *Evidence Type*: Common practice.
126. *Confidence Level*: Medium.
127. **Williams %R Pullback Strategy** – (Parent Family: Technical – Momentum, Type: Variation)
128. *Core Logic*: Williams %R measures overbought/oversold conditions; reading below -80 indicates oversold; above -20 indicates overbought.
129. *How it Works*: When price is in uptrend and %R drops below -80 then returns above -50, go long; in downtrend, if %R rises above -20 then falls back below -50, go short.
130. *Typical Use Case*: Entering on pullbacks within a trend.
131. *Known Users/Origin*: Created by Larry Williams; widely used.
132. *Evidence Type*: Institutional/Academic and common practice.
133. *Confidence Level*: Medium.
134. **Commodity Channel Index (CCI) Breakout** – (Parent Family: Technical – Momentum, Type: Variation)
135. *Core Logic*: Use CCI values above +100 or below -100 to signal strong momentum; trade breakouts accordingly.
136. *How it Works*: Calculate CCI over 20 periods; when CCI crosses above +100 and price breaks resistance, go long; cross below -100 with support break signals short.
137. *Typical Use Case*: Capturing momentum bursts in crypto derivatives.
138. *Known Users/Origin*: Donald Lambert's indicator; widely used.
139. *Evidence Type*: Institutional/Academic and common practice.
140. *Confidence Level*: Medium.
141. **Fibonacci Retracement Bounce** – (Parent Family: Technical – Mean Reversion, Type: Variation)
142. *Core Logic*: Use Fibonacci ratios (e.g., 38.2%, 50%, 61.8%) as potential support/resistance during retracements in a trending market.
143. *How it Works*: After an impulse move, measure range; place buy orders at key Fibonacci levels; stop below deeper level; target prior high.
144. *Typical Use Case*: Trend continuation trades when price pulls back to key Fibonacci levels.
145. *Known Users/Origin*: Based on Fibonacci sequence; widely used in TA; origin not clearly attributable.

146. *Evidence Type*: Common practice.
147. *Confidence Level*: Medium.
148. **Pivot Point Reversion** – (Parent Family: Technical – Mean Reversion, Type: Variation)
149. *Core Logic*: Use daily/weekly pivot points to identify intraday support/resistance; fade moves near these levels expecting reversion to pivot.
150. *How it Works*: Calculate pivot (P) = (High + Low + Close) / 3; derive support/resistance lines (S1,S2,R1,R2); if price spikes to R2, short expecting move back to pivot.
151. *Typical Use Case*: Day trading on liquid perpetual futures pairs.
152. *Known Users/Origin*: Floor traders; widely taught in trading literature.
153. *Evidence Type*: Common practice.
154. *Confidence Level*: Medium.
155. **Relative Strength Index (RSI) Overbought/Oversold** – (Parent Family: Technical – Indicator-Based, Type: Core)
156. *Core Logic*: Identify overbought (>70) or oversold (<30) levels on RSI; trade mean reversion back to neutral.
157. *How it Works*: Calculate RSI over 14 periods; if RSI crosses above 70 and price shows divergence, consider short; if RSI below 30 with bullish divergence, consider long.
158. *Typical Use Case*: Short-term swing trades; altcoins with high volatility.
159. *Known Users/Origin*: J. Welles Wilder's indicator; widely adopted.
160. *Evidence Type*: Institutional/Academic (original formula) and common practice.
161. *Confidence Level*: High.
162. **RSI Trend-Confirmation (RSI 50 Base)** – (Parent Family: Technical – Indicator-Based, Type: Variation)
163. *Core Logic*: Use RSI crossing 50 as trend confirmation rather than overbought/oversold; above 50 indicates momentum long; below indicates bearish momentum.
164. *How it Works*: Monitor RSI; if RSI goes from below to above 50 with rising price, enter long; exit when RSI crosses back below.
165. *Typical Use Case*: Trend-following system for intraday or daily charts.
166. *Known Users/Origin*: Market technicians; not clearly attributable.
167. *Evidence Type*: Common practice.
168. *Confidence Level*: Medium.
169. **Relative Strength Index Divergence** – (Parent Family: Technical – Indicator-Based, Type: Variation)
170. *Core Logic*: Identify bullish or bearish divergence between price and RSI to anticipate reversals.

171. *How it Works*: When price makes a lower low but RSI forms a higher low, it signals weakening selling pressure; traders go long. Conversely, a higher high in price with lower high in RSI signals potential top; traders short.
172. *Typical Use Case*: Early detection of momentum reversals, used by discretionary traders.
173. *Known Users/Origin*: Common practice in technical analysis.
174. *Evidence Type*: Common practice.
175. *Confidence Level*: Medium.
176. **Moving Average Convergence Divergence (MACD) Cross** – (Parent Family: Technical – Indicator-Based, Type: Core)
177. *Core Logic*: Use MACD line crossing the signal line to generate buy/sell signals.
178. *How it Works*: Calculate fast and slow EMAs (e.g., 12 and 26 periods); $MACD = Fast\ EMA - Slow\ EMA$; signal line is 9-period EMA of MACD; when MACD crosses above signal line, go long; cross below, exit or short.
179. *Typical Use Case*: Capturing medium-term momentum shifts on daily/4-hour charts.
180. *Known Users/Origin*: Developed by Gerald Appel; widely used.
181. *Evidence Type*: Common practice.
182. *Confidence Level*: High.
183. **MACD Histogram Zero-Line Cross** – (Parent Family: Technical – Indicator-Based, Type: Variation)
184. *Core Logic*: Trade when MACD histogram crosses zero, indicating MACD line crossing signal line; used as confirmation of momentum change.
185. *How it Works*: Wait for histogram to go from negative to positive for long entry; exit when it flips negative; combine with price patterns for improved accuracy.
186. *Typical Use Case*: Swing trading trending altcoins.
187. *Known Users/Origin*: Variation of MACD usage; no single origin.
188. *Evidence Type*: Common practice.
189. *Confidence Level*: Medium.
190. **Stochastic Oscillator Overbought/Oversold** – (Parent Family: Technical – Indicator-Based, Type: Core)
191. *Core Logic*: Use %K and %D lines of the stochastic oscillator; values above 80 indicate overbought, below 20 indicate oversold.
192. *How it Works*: Compute oscillator using closing price relative to high-low range; cross of %K above %D from below 20 signals long; cross down from above 80 signals short.
193. *Typical Use Case*: Short-term mean-reversion trades in range-bound markets.
194. *Known Users/Origin*: Developed by George Lane; widely taught.
195. *Evidence Type*: Institutional/Academic and common practice.

196. *Confidence Level*: Medium.

197. **Stochastic RSI** – (Parent Family: Technical – Indicator-Based, Type: Variation)

198. *Core Logic*: Apply stochastic formula to RSI values; yields more sensitive overbought/oversold signals.

199. *How it Works*: Calculate RSI then apply stochastic; overbought/oversold thresholds used to enter/exit; often used in combination with trend filters.

200. *Typical Use Case*: Scalping or intraday trading; altcoins with high volatility.

201. *Known Users/Origin*: Variation developed by Tushar Chande and Stanley Kroll.

202. *Evidence Type*: Institutional/Academic and common practice.

203. *Confidence Level*: Medium.

204. **Average True Range (ATR) Trailing Stop** – (Parent Family: Technical – Indicator-Based, Type: Core)

205. *Core Logic*: Use ATR to adaptively set stop-loss distances from current price; maintain open positions while trailing stops adjust with volatility.

206. *How it Works*: Compute ATR over a set period; stop-loss is placed at $k \times \text{ATR}$ below current price for long trades; adjust daily as price moves.

207. *Typical Use Case*: Trend followers wanting to stay in trades while allowing for normal volatility swings.

208. *Known Users/Origin*: J. Welles Wilder; widely used by Turtle traders and system traders.

209. *Evidence Type*: Institutional/Academic and common practice.

210. *Confidence Level*: High.

Comprehensive Map of Crypto Trading Strategies

This document compiles a large set of cryptocurrency trading strategies grouped by category. Each numbered entry describes a distinct approach together with its parent family, type, variation, concise logic, mechanics, typical use, origin, evidence type and a subjective confidence level. Citations from credible sources support the general concepts behind these strategies, such as the use of moving averages for trend identification ², narrative rotation in crypto markets ³, perpetual funding and basis trading mechanisms ⁴ ⁵, options volatility skew ⁶, on-chain indicators like whale tracking and exchange flows ⁷, miner behaviour and halving cycles ⁸ ⁹, macro liquidity correlations ¹⁰, liquidation cluster analysis ¹¹, DeFi yield strategies ¹², social sentiment gauges ¹³, open interest analysis ¹⁴, support/resistance and candlestick patterns ¹⁵ ¹⁶, risk management practices ¹⁷, arbitrage techniques ¹⁸, statistical arbitrage ¹⁹, impermanent loss mitigation ²⁰, high-frequency trading and bots ²¹ ²², volume analysis ¹, machine-learning models for price prediction ²³ and token unlock dynamics ²⁴.

Technical Strategies

1. **Simple Moving Average (SMA) Cross** – (Parent Family: Technical – Trend Following, Type: Core)

2. *Core Logic*: Compute short- and long-period SMAs; when the short SMA crosses above the long SMA, go long; cross below indicates exit or short. ²

3. *How it Works*: The trader calculates SMAs on closing prices (e.g., 50-day vs 200-day) and uses the crossover as a momentum signal; positions are updated when crosses occur.
4. *Typical Use Case*: Position traders seeking to capture sustained up- or down-trends in major cryptocurrencies.
5. *Known Users/Origin*: Common practice among technical traders; widely used in equity and crypto markets; specific origin not clearly attributable.
6. *Evidence Type*: Common practice; educational articles explaining moving averages in crypto ².
7. *Confidence Level*: High.

8. **Exponential Moving Average (EMA) Cross** – (Parent Family: Technical – Trend Following, Type: Subtype)

9. *Core Logic*: Same as SMA cross but EMAs weight recent data more heavily, offering faster reaction to price changes ²⁵.
10. *How it Works*: Compute EMAs (e.g., 20-EMA and 50-EMA) and trade on crossovers; use EMAs for dynamic support/resistance during trending markets.
11. *Typical Use Case*: Shorter-term traders requiring sensitivity to rapid price movements.
12. *Known Users/Origin*: Popular among day traders and algorithmic systems; origin not clearly attributable.
13. *Evidence Type*: Common practice; technical analysis literature ²⁵.
14. *Confidence Level*: High.

15. **Weighted Moving Average (WMA) Cross** – (Parent Family: Technical – Trend Following, Type: Subtype)

16. *Core Logic*: Like EMA but weights linearly; emphasises recent price points while still considering longer history ²⁵.
17. *How it Works*: Calculate WMAs with chosen periods; crossovers generate entry/exit signals.
18. *Typical Use Case*: Traders balancing between SMA smoothness and EMA responsiveness.
19. *Known Users/Origin*: Technical analysts; origin not clearly attributable.
20. *Evidence Type*: Common practice.
21. *Confidence Level*: High.

22. **Hull Moving Average (HMA) Trend** – (Parent Family: Technical – Trend Following, Type: Variation)

23. *Core Logic*: Use HMA to reduce lag and improve smoothing, providing earlier entries while limiting noise.
24. *How it Works*: Compute HMA (combining WMA and sqrt periods) and use its slope or cross with price as trend filter; when HMA turns upward, go long.
25. *Typical Use Case*: Swing traders wanting quick trend identification without false signals.
26. *Known Users/Origin*: Introduced by Alan Hull in equity trading; adopted by crypto traders; not clearly attributable specifically to crypto.

27. *Evidence Type*: Common practice.
28. *Confidence Level*: Medium.
29. **Moving Average Ribbon** – (Parent Family: Technical – Trend Following, Type: Variation)
30. *Core Logic*: Use multiple moving averages across different lengths to form a “ribbon”; the alignment (all pointing up) indicates strong trends.
31. *How it Works*: Plot a series of EMAs (e.g., 20, 50, 100, 200) and interpret the spacing; go long when shorter MAs align above longer MAs; exit when the ribbon compresses or inverts.
32. *Typical Use Case*: To visualise momentum and avoid premature exits in trending markets.
33. *Known Users/Origin*: First popularised by traders like Gerald Appel; widely used across asset classes.
34. *Evidence Type*: Common practice.
35. *Confidence Level*: Medium.
36. **Moving Average Envelope** – (Parent Family: Technical – Mean Reversion, Type: Variation)
37. *Core Logic*: Create bands around a moving average at fixed percentage distances; price deviations beyond the bands are considered overextended.
38. *How it Works*: Plot a central SMA/EMA and calculate upper/lower envelopes (e.g., $\pm 2\%$); buy when price touches lower band and sell at upper band.
39. *Typical Use Case*: Range-bound markets with mean-reverting characteristics in mid-cap altcoins.
40. *Known Users/Origin*: Adapted from equity strategies; common among swing traders.
41. *Evidence Type*: Common practice.
42. *Confidence Level*: Medium.
43. **Breakout from Consolidation** – (Parent Family: Technical – Breakout, Type: Core)
44. *Core Logic*: Identify consolidation ranges and enter when price breaks above resistance or below support, anticipating momentum continuation ¹⁵.
45. *How it Works*: Draw horizontal support/resistance based on previous highs/lows; place stop orders just beyond these levels; confirm with volume spikes.
46. *Typical Use Case*: Day traders capturing volatile moves following range compression.
47. *Known Users/Origin*: Widely used across markets; no single origin.
48. *Evidence Type*: Common practice; price-action education ¹⁵.
49. *Confidence Level*: High.
50. **Volatility Breakout (Keltner/ATR)** – (Parent Family: Technical – Breakout, Type: Subtype)
51. *Core Logic*: Use Average True Range (ATR) or Keltner Channels to set volatility-based bands; trade when price closes outside the band.

52. *How it Works*: Calculate ATR-based channel around an EMA; go long when price exceeds upper band with rising volume; set stop at opposite band.
53. *Typical Use Case*: Trend followers looking for early entry after volatility expansion.
54. *Known Users/Origin*: Chester Keltner developed channels; widely applied in commodities and crypto.
55. *Evidence Type*: Common practice.

56. *Confidence Level*: Medium.

57. Bollinger Band Squeeze Breakout – (Parent Family: Technical – Breakout, Type: Subtype)

58. *Core Logic*: Recognise narrowing of Bollinger Bands as signal of low volatility; breakouts follow significant expansions.

59. *How it Works*: Plot Bollinger Bands (20-SMA ± 2 standard deviations); when bands constrict, set alerts; buy if price closes above upper band on expanding volume, sell if below lower band.

60. *Typical Use Case*: Traders anticipating large moves after periods of low volatility.

61. *Known Users/Origin*: Created by John Bollinger; widely used.

62. *Evidence Type*: Common practice.

63. *Confidence Level*: High.

64. Ascending Triangle Breakout – (Parent Family: Technical – Pattern-Based, Type: Core)

65. *Core Logic*: Price forms rising lows and horizontal resistance; breakout above resistance often signals continuation.

66. *How it Works*: Identify at least two rising swing lows and a flat top; draw trendline; enter long on confirmed breakout with high volume; place stop below the last higher low.

67. *Typical Use Case*: Bullish pattern seen in trending markets; used on Bitcoin or large-cap altcoins.

68. *Known Users/Origin*: Classic chartist strategy; widely discussed in technical analysis texts.

69. *Evidence Type*: Common practice.

70. *Confidence Level*: Medium.

71. Descending Triangle Breakdown – (Parent Family: Technical – Pattern-Based, Type: Core)

72. *Core Logic*: Mirror of ascending triangle; flat support with lower highs; breakdown signals bearish continuation.

73. *How it Works*: Draw flat support line connecting lows and descending trendline connecting lower highs; sell short or exit long when price closes below support with high volume.

74. *Typical Use Case*: Bearish continuation pattern in downtrending markets.

75. *Known Users/Origin*: Classic pattern.

76. *Evidence Type*: Common practice.

77. *Confidence Level*: Medium.

78. Head-and-Shoulders Reversal – (Parent Family: Technical – Pattern-Based, Type: Core)

79. *Core Logic*: Three peaks with middle one higher; neckline break signals trend reversal.
80. *How it Works*: Identify left shoulder, head, and right shoulder; draw neckline across troughs; short when price breaks neckline; measure distance from head to neckline to estimate target.
81. *Typical Use Case*: Spotting top formations before bearish reversals; widely used across markets.
82. *Known Users/Origin*: Old pattern; widely studied.
83. *Evidence Type*: Common practice.
84. *Confidence Level*: Medium.
85. **Inverse Head-and-Shoulders Reversal** – (Parent Family: Technical – Pattern-Based, Type: Variation)
86. *Core Logic*: Inverted head-and-shoulders indicating bearish trend reversal into bullish move.
87. *How it Works*: Find three troughs with deepest middle trough; draw neckline; enter long when price breaks above neckline with volume; target measured move.
88. *Typical Use Case*: Market bottom formation; used by swing traders for medium-term entries.
89. *Known Users/Origin*: Classic pattern.
90. *Evidence Type*: Common practice.
91. *Confidence Level*: Medium.
92. **Cup and Handle Breakout** – (Parent Family: Technical – Pattern-Based, Type: Core)
93. *Core Logic*: Round bottom (cup) followed by small pullback (handle); breakout above handle indicates continuation.
94. *How it Works*: Identify U-shaped consolidation then handle; buy on breakout with increased volume; set stop below handle.
95. *Typical Use Case*: Bullish continuation pattern for mid-cap coins after lengthy consolidation.
96. *Known Users/Origin*: William O'Neil popularised in equity trading.
97. *Evidence Type*: Common practice.
98. *Confidence Level*: Medium.
99. **Bullish Engulfing Candlestick Reversal** – (Parent Family: Technical – Pattern-Based, Type: Subtype)
100. *Core Logic*: A small bearish candle is followed by a larger bullish candle that completely engulfs it; indicates a shift from sellers to buyers ¹⁶.
101. *How it Works*: After a downtrend, watch for the pattern; enter long at close of the bullish candle; place stop below pattern; confirm with volume spikes and other indicators.
102. *Typical Use Case*: Short-term swing trades capturing immediate reversals on daily or 4-hour charts.
103. *Known Users/Origin*: Widely used in Japanese candlestick analysis ¹⁶.
104. *Evidence Type*: Common practice; pattern described in educational sources ¹⁶.
105. *Confidence Level*: High.

106. **Bearish Engulfing Candlestick Reversal** – (Parent Family: Technical – Pattern-Based, Type: Subtype)

107. *Core Logic*: A small bullish candle followed by a larger bearish candle that engulfs it; signals reversal downward.

108. *How it Works*: Occurs after an uptrend; traders sell or short at close of bearish candle; stop above pattern high.

109. *Typical Use Case*: Short-term reversal trades on daily/4-hour charts.

110. *Known Users/Origin*: Candlestick charting from Japanese traders; widely used.

111. *Evidence Type*: Common practice.

112. *Confidence Level*: High.

113. **Three White Soldiers / Three Black Crows** – (Parent Family: Technical – Pattern-Based, Type: Variation)

114. *Core Logic*: Three consecutive strong bullish (white soldiers) or bearish (black crows) candlesticks signify trend continuation or reversal.

115. *How it Works*: After a downtrend, three long green candles with higher closes signal buying strength; conversely, three long red candles after an uptrend signal selling strength; entry at close of third candle; stops below first candle.

116. *Typical Use Case*: Confirmation of reversal or continuation signals.

117. *Known Users/Origin*: Traditional candlestick pattern; widely described.

118. *Evidence Type*: Common practice.

119. *Confidence Level*: Medium.

120. **Support Bounce Strategy** – (Parent Family: Technical – Price Action, Type: Core)

121. *Core Logic*: Trade long when price tests a known support level and shows rejection; anticipate bounce due to accumulated buy orders ¹⁵.

122. *How it Works*: Identify horizontal support from prior lows or high-volume nodes; enter when price candles show wicks and close above support; place stop below the level.

123. *Typical Use Case*: Range-bound markets where price oscillates between support and resistance.

124. *Known Users/Origin*: Generic price-action methodology; widely used.

125. *Evidence Type*: Common practice; support/resistance concept explained in crypto context ¹⁵.

126. *Confidence Level*: High.

127. **Resistance Short Strategy** – (Parent Family: Technical – Price Action, Type: Variation)

128. *Core Logic*: Sell or short when price tests a known resistance level and fails to break through, expecting a pullback ¹⁵.

129. *How it Works*: Draw resistance lines; watch for rejection candles (long upper wicks) and declining volume; enter short with stop just above resistance; target move to next support.
130. *Typical Use Case*: Profiting from retracements within a range or after extended rallies.
131. *Known Users/Origin*: Price-action traders.
132. *Evidence Type*: Common practice ¹⁵ .
133. *Confidence Level*: High.
134. **Mid-Range Mean Reversion** – (Parent Family: Technical – Mean Reversion, Type: Core)
135. *Core Logic*: Enter long when price is at the lower bound of a defined range and short at the upper bound, betting on reversion to the mean.
136. *How it Works*: Define a trading range using Bollinger Bands, price channels or statistical measures; place limit orders near extremes; close trades near mid-line or opposite band.
137. *Typical Use Case*: Sideways markets with low volatility; altcoin pairs with stable liquidity.
138. *Known Users/Origin*: Derived from mean-reversion theory; widely used by quantitative traders.
139. *Evidence Type*: Common practice.
140. *Confidence Level*: Medium.
